

Law of Attraction, is it related to the Scientific Fundamental Interaction?

Law of Attraction, is it related to the Scientific Fundamental Interaction?

The idea that attraction is a power of nature is something scientists have known about for a while. They say it is one of 4 fundamentals of nature.

Newton spoke of the law of gravity, regarding objects in the universe being attracted by other objects. Einstein believed that the objects that were attracted to each other were made with that purpose to be attracted like the celestial bodies are attracted to each other as the sun, moon and earth are. There is much yet to be learned about the law of attraction and how to relate it to scientific principals but studies are still being conducted. We are still learning how to relate what past scientists have known and apply it to new technologies of today. Einstein once said, "The most beautiful thing we can experience is the mysterious. It is the source of all true art and all science." Something's remain a mystery to us, with our limited ability to understand or comprehend; yet we still continue to explore the theories and fundamentals of nature.

There are certain truths that have existed throughout time and are linked to the power of attractions. An example would be that gratitude tends to attract more gratefulness. When you express how grateful you are for say, your food, or your pay and truly mean the feelings of gratitude you have; that meaning reflects itself in action and you act like you are grateful for having those things. Your actions will pull or attract to you more of the like things that you can be grateful for also. Apply this to the idea of success or joy and these will also be attracted to you. Like attracts like, is a fundamental principal of the law of attraction.

Quantum physics touches on this theory of attraction as it explains that everything is made of vibrating energy. The energy formula that Einstein came up with ($E=mc^2$) shows that energy is interchangeable and related to matter. This means that anything made of matter contains energy. Your thought patterns ooze with energy that attracts to you what you think about. The negative and the positive thoughts are attracting like to like.

It is a common expression that most of us have heard when speaking of couples: opposites attract. It usually means that the two individuals making up the couple are opposite each other in very fundamental ways. One may be smart the other lacks smarts, one is very conservative and follows rules while the other is very loose and spontaneous. What makes them opposites actually attracts each of them to the other and they become a couple that compliments each other. Their relationship may eventually suffer as the very things that attracted them start to really bother them unless they have an underlying and powerful attraction or force that continues to draw them together. We usually call this force love.

One quantum theory called the "Super symmetric string theory" attempts to explain that particles and fundamental forces of nature are modeled as vibrations of tiny super symmetric strings. Each one of these "strings" has its resonance. Strings of like resonances attract to each other. If you have a vibration or thought pattern that you will never be wealthy because you have always been poor and will most likely always be poor and this defeatist attitude permeates your thoughts on a consistent basis, this is your vibration and this is what you will attract to you. Your thoughts and actions you take will be focused on being resigned to always being poor. The opposite is true; focus your thought patterns on thinking about how it will be when you have all the money you desire and your actions will follow the thought patterns and you will attract more thoughts and actions that are focused on the lifestyle you envision when you have the money you desire.

About the Author

Halille is an expert in meditation and positive thinking, he wrote several ebooks on this broad subject with his scientific outlook. You can check one of his favorite recommendation [Law of attraction](#) , a pure gem that just a few people had the chance to experience.
